Bob -

During our review of the Round 3 data it was noted that some of the detection limits for PCB congeners (ie, PCB 126) in tissue are high. Ginna Grepo-Grove is following up and would like to review a copy of the the validation memo and worksheet accompanying the R3 data report and a data package. Can you have Integral contact Ginna and arrange to send one to her? A PDF file would be easiest to work with.

thanks
Chip
